

TEST DOCUMENTATION REPORT

Wipro Capstone Project

Project Title	Wipro Capstone — MakeMyTrip Bus Module
Project ID	Ayush_Jaiswal_5470846_WiproCapstone
Prepared By	Ayush Jaiswal
Superset ID	5470846
Program	TRAINING (Selenium with Python B2)
Date of Preparation	23 May 2026
Document Status	Final

1. PROJECT DESCRIPTION

1.1 Overview

This project automates the core MakeMyTrip Bus Booking workflow, including bus search, bus listing validation, filter functionality, passenger detail submission, and payment page navigation. The framework is developed using Selenium WebDriver, Python, and Pytest to ensure application reliability, execution stability, and efficient automation testing.

The framework follows the Page Object Model (POM) design pattern, which separates web element locators and page actions from the test scripts, improving code maintainability, readability, and reusability.

Furthermore, the project also incorporates a Behavior-Driven Development (BDD) approach using Behave. By implementing Gherkin syntax with Given, When, Then statements, the framework converts technical automation scripts into plain-English scenarios, creating readable and maintainable living documentation aligned with business requirements.

The framework supports Data-Driven Testing (DDT) using external CSV and Excel files for executing multiple test scenarios without modifying the automation scripts. It also includes custom logging utilities, automatic screenshot capture, and Allure Reporting integration for better debugging, execution tracking, and professional test reporting.

Overall, the project validates both positive and negative scenarios along with a complete end-to-end bus booking workflow to ensure the functionality, stability, and usability of the MakeMyTrip Buses module.

1.2 Test Strategy

1.2.1 Test Strategy for Selenium Pytest

The testing strategy for this project is designed to validate the major functionalities of the MakeMyTrip Bus Booking application through a structured and maintainable automation framework.

The framework uses Selenium WebDriver for browser automation and Pytest as the test execution framework. The Page Object Model (POM) design pattern is

implemented to separate web element locators and page actions from test scripts, improving code maintainability, readability, and reusability.

Data-Driven Testing (DDT) is implemented using CSV and Excel files. CSV files are used for bus search test data, while Excel files are used for passenger and payment information. This approach allows execution of multiple test scenarios without modifying the automation scripts.

The framework also includes logging and screenshot capture utilities for better debugging, execution tracking, and reporting. Allure Reporting integration is implemented to generate detailed HTML execution reports with screenshots, logs, and test execution status.

The Selenium Pytest framework validates positive, negative, and complete end-to-end test scenarios, ensuring that the MakeMyTrip Buses module functions correctly under different user conditions and validations.

1.2.2 Test Strategy for BDD Behave

The testing strategy for this project is designed to validate the major functionalities of the MakeMyTrip Bus Booking application through a structured and highly readable behavior-driven automation framework.

The framework uses the Behave library as the core BDD execution engine to bridge the gap between business requirements and technical automation scripts. The Gherkin syntax (Given/When/Then) is implemented to separate plain-English test scenarios in feature files from the underlying Python step definitions, improving collaboration, readability, and requirement traceability.

Data-Driven Testing (DDT) is implemented using Gherkin Scenario Outlines along with CSV and Excel files. CSV files are used for bus search test data, while Excel files are consumed for passenger and payment details directly within the step definitions. This approach allows execution of multiple test scenarios without modifying the core feature files or automation scripts.

The framework also includes custom environmental hooks (environment.py), automatic screenshot capture, logging utilities, and Allure integration for better debugging, execution tracking, and visually rich reporting.

The BDD Behave framework validates positive, negative, and complete end-to-end booking scenarios while acting as living documentation for the MakeMyTrip Buses module.

2. TEST ENVIRONMENT

2A. Selenium ,Pytest — Environment

- **Operating System:** Windows 11
- **IDE:** [PyCharm]
- **Programming Language:** Python 3.13.7
- **Execution Framework:** Pytest
- **Automation Tool:** Selenium WebDriver (utilizing SeleniumBase for UC Mode and advanced browser handling)
- **Design Pattern:** Page Object Model (POM) for centralized web element management
- **Test Data Management:** External data injection using CSV / Excel readers (pandas or openpyxl) via Pytest parameterization
- **Dependencies:**

requirement.txt--

- Selenium
- webdriver-manager
- pytest
- Allure-pytest
- openpyxl
- pytest-order
- **Reporting & Logging:**
 - **Reports:** Allure HTML Reporting Framework (or Pytest-HTML)
 - **Logs:** Custom Python logging utility capturing detailed runtime traces and saving them to Logs/automation.log

2B. BDD behave — Environment

- **Operating System:** Windows 11
- **IDE:** PyCharm

- **Programming Language:** Python 3.13.7
- **Execution Framework:** Behave (Behavior-Driven Development)
- **Automation Tool:** Selenium WebDriver (utilizing SeleniumBase for UC Mode)
- **Design Pattern:** Page Object Model (POM) injected dynamically via environment.py hooks
- **Test Data Management:** Gherkin Scenario Outlines combined with dynamic CSV / Excel reading within step definitions
- **Dependencies:**

requirements.txt--

- selenium
- seleniumbase
- behave
- webdriver-manager
- allure-behave
- pytest
- openpyxl
- configparser
- gherkin-official
- **Reporting & Logging:**
 - **Reports:** Allure HTML Reporting generated via allure_behave.formatter
 - **Logs:** Custom Python logging capturing runtime data, strictly attached to the Allure lifecycle within the after_step and after_scenario hooks

3. TEST EXECUTION

3A. Selenium + Pytest — Test Execution

Test Summary

Metric	Value
Total Test Cases	7
Positive Test Cases	4
Negative Test Cases	2
End-to-End Flows	1
Test Execution Mode	Sequential — Chrome (headed)
Avg. Execution Time	~4 minutes (full suite)

End-to-End Test Flow

The core End-to-End (E2E) test simulates a complete real-world user journey for booking a bus ticket on the MakeMyTrip Buses module. Driven by Pytest and parameterized using external Excel test data, the automation script executes a complete booking workflow while capturing screenshots, logs, and Allure reports at every major stage.

The 7-Phase Execution Pipeline:

1. Phase 1: Application Launch & Bus Search

- The framework launches the MakeMyTrip application.
- It closes the login popup and navigates to the Buses section.
- Source city and destination city values are dynamically read from the Excel dataset.
- The script enters the From and To locations.
- The journey date is selected from the calendar.
- Finally, the Search Buses button is clicked to initiate the search operation.

2. Phase 2: Bus Listing Validation & Filter Application

- Upon reaching the bus search results page, the framework validates that the results container is loaded successfully.
- The script applies important business filters such as: AC buses and Available seats
- It validates that the displayed bus listings match the selected filter criteria.

3. Phase 3: Bus Selection, Seat Selection & Boarding/Dropping Point Selection

- The framework dynamically locates and selects the first available bus from the filtered results.
- It navigates to the seat layout section and identifies an available seat for booking.
- During the seat selection process, the script also selects: Boarding Point and Dropping Point.
- The framework validates that the seat, boarding point, and dropping point are selected successfully before proceeding further.

4. Phase 4: Complete Booking Page & Passenger Detail Submission

- After successful seat and boarding/dropping selection, the application navigates to the Complete Booking page.
- The framework fills the required passenger information dynamically from the Excel dataset, including: Passenger Name, Age and Gender.
- Contact information such as Email ID and Mobile Number is also populated successfully.

5. Phase 5: Payment Navigation

- The script validates mandatory acknowledgement checkboxes and travel policy confirmations if displayed.
- It then clicks the Continue or Proceed to Payment button.
- The application is successfully redirected to the secure payment gateway environment.

6. Phase 6: Payment Page Validation & Card Details Entry

- The framework validates that the payment page is loaded successfully.
- The Credit/Debit Card payment option is selected.
- Dummy payment details are dynamically injected from the Excel dataset, including: Card Number, Expiry Date, CVV and Card Holder Name.
- The framework validates that the payment continuation process becomes active successfully.
- **Final Assertion:** The test concludes with a strict Pytest assertion validating that the application successfully reaches the secure payment environment without any execution failure, UI interruption, or navigation issue.

Positive Test Cases (4)

1. **Verify route information using valid source and destination cities :** This test validates that the MakeMyTrip Buses module successfully displays the correct route information after entering valid source city, destination city, and journey date details.

Validation: It validates that the displayed route information on the bus listing page matches the entered source and destination cities correctly.

2. **Verify bus filter functionality using AC filter :** This test validates the AC filter functionality available on the bus listing page.

Validation: It validates that after applying the AC filter, only AC buses are displayed successfully in the search results.

3. **Verify selected seat validation during complete booking flow.**

This scenario validates whether the selected seat is displayed correctly during the complete booking process.

Validation: It validates that the selected seat number matches correctly on the Complete Booking page after seat selection.

4. **Verify source and destination city validation on Complete Booking page.**

This scenario validates whether the correct source and destination cities are displayed on the Complete Booking page after selecting a bus.

Validation: It validates that the displayed source and destination city names on the Complete Booking page match the originally searched route information correctly.

Negative Test Cases (2)

1. **Validate application behavior when the same source and destination cities are entered.**

This test verifies the logical validation of the MakeMyTrip Buses module when the user enters the same city in both the source and destination fields.

Validation: It validates that the application prevents the bus search operation and displays the validation message “The Departure City and Destination City cannot be the same. Please re-type.”

2. **Verify application behavior when buses are unavailable for a very long route.**

This scenario validates the system behavior when the user searches for a route where bus services are unavailable.

Validation: It validates that the application displays the “No Buses Found” message on the bus listing page and prevents the user from proceeding further in the booking workflow.

3B. BDD behave — Test Execution

Test Summary

Metric	Value
Total Scenarios	7
Positive Scenarios	4
Negative Scenarios	2
End-to-End Flows	1
Feature Files	2
Avg. Execution Time	~4.5 minutes (full suite)

End-to-End Scenario

Overview

The core End-to-End (E2E) scenario validates the complete bus ticket booking workflow of the MakeMyTrip Buses module through a Behavior-Driven Development (BDD) approach. Written in plain-English Gherkin syntax, the scenario acts as living documentation while executing a complete automation workflow powered by Behave, Selenium, and external Excel test data.

The Execution Pipeline:

Phase 1: Application Launch & Data Loading

- **Gherkin Steps:** Given User launches MakeMyTrip application, and User loads test data from Excel "bus_e2e_data.xlsx".
- **Action:** The framework initializes the Selenium WebDriver, launches the MakeMyTrip application, and dynamically loads source city, destination city, passenger details, and payment details from the external Excel dataset into the Behave context object.

Phase 2: Navigation & Bus Search

- **Gherkin Steps:** When User closes the login popup, and User navigates to the Bus section, and User enters source city from Excel, and User enters destination city from Excel, and User selects a travel date, and User clicks on Search Buses button.
- **Action:** The framework handles the login popup, navigates to the Buses module, enters source and destination cities from the Excel dataset, selects the journey date, and performs the bus search operation successfully.

Phase 3: Bus Listing Validation & Filter Application

- **Gherkin Steps:** And User applies the AC filter, and User selects an available bus.
- **Action:** The framework validates the successful loading of the bus listing results page, applies the AC filter, and dynamically selects an available bus from the filtered search results.

Phase 4: Seat Selection & Boarding/Dropping Verification

- **Gherkin Steps:** And User selects a specific seat, and User verifies boarding and dropping points.
- **Action:** The framework navigates to the seat layout section, selects an available seat successfully, and validates that the boarding point and dropping point information are displayed correctly before proceeding further.

Phase 5: Passenger Details & Payment Navigation

- **Gherkin Steps:** And User enters passenger details from Excel, and User proceeds to payment page.
- **Action:** The framework fills passenger and contact details dynamically from the Excel dataset and proceeds to the secure payment gateway page successfully.

Phase 6: Payment Details Submission

- **Gherkin Steps:** And User enters card details from Excel, Then Close the browser.
- **Action:** The framework validates the payment page, enters dummy card details dynamically from the Excel dataset, completes the final payment with print stage validation, and safely closes the browser session.

Positive Scenarios (4)'

1. Verify that searched route information displayed correctly.

This scenario validates that the MakeMyTrip Buses module correctly displays the searched route information after entering valid source city and destination city details from the CSV dataset.

- **Validation:** It validates that the displayed route information on the bus results page matches the source and destination cities provided in the CSV test data.

2. Assert whether sleeper filter is applied successfully.

This scenario validates the Sleeper filter functionality available on the bus listing page.

- **Validation:** It validates that after applying the Sleeper filter, the bus listing results dynamically update and display only buses matching the Sleeper category successfully.

3. Assert seat number selection.

This scenario validates whether the selected seat number is displayed correctly after seat selection during the booking workflow.

- **Validation:** It validates that the selected seat number shown on the booking page matches the seat selected by the user during seat selection.

4. Assert Booking Page details are correct.

This scenario validates whether the booking page displays the correct route information after bus and seat selection.

- **Validation:** It validates that the source and destination city details displayed on the booking page correctly match the original route information provided from the CSV dataset.

Negative Scenarios (2)

1. Verify that buses are not displayed for the same source and destination.

This scenario validates the logical validation of the MakeMyTrip Buses module when the same city is entered in both source and destination fields.

- **Validation:** It validates that the application prevents the search operation and displays the validation message “The Departure City and Destination City cannot be the same. Please re-type.”

2. Verify that No Buses Found message is displayed when invalid route is selected .

This scenario validates the application behavior when a very long or unavailable route is searched where bus services are not available.

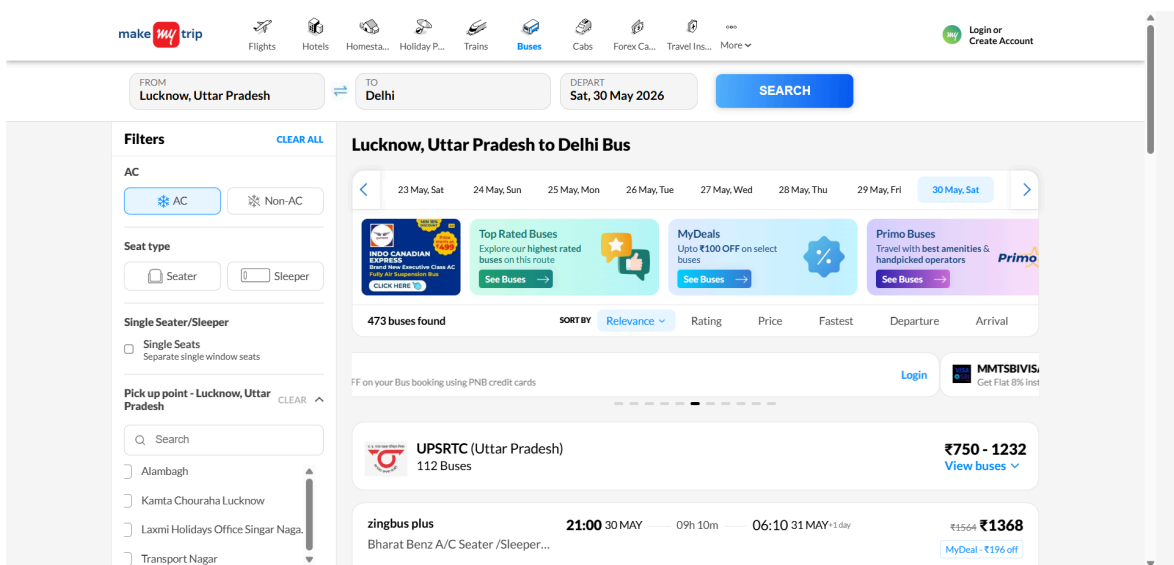

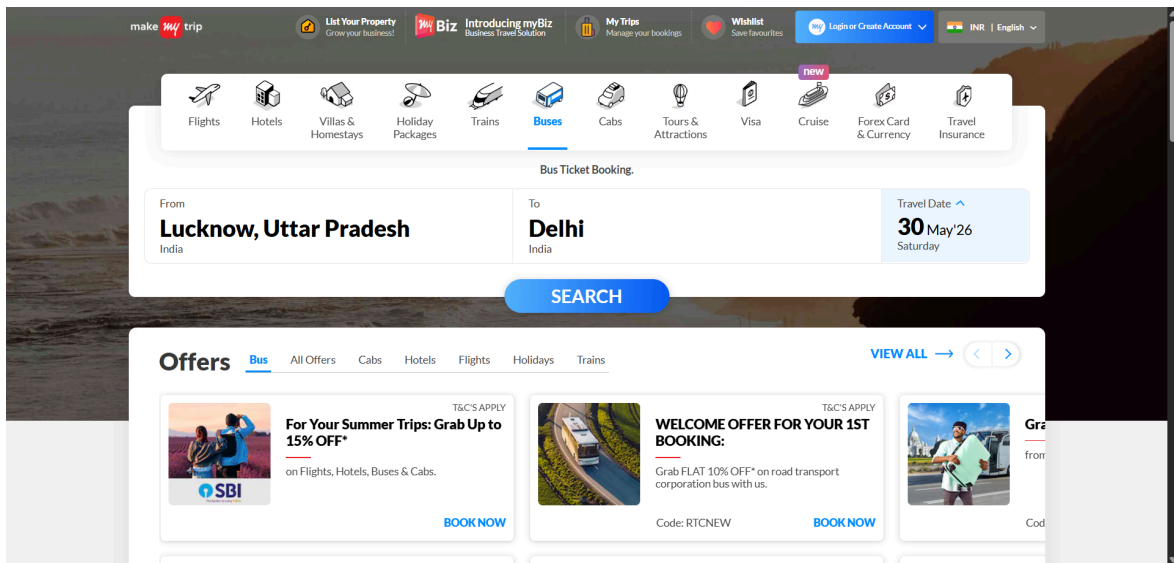

- **Validation:** It validates that the application displays the “No Buses Found” message on the bus listing page and prevents the user from proceeding further in the booking workflow.

4. TEST OUTPUTS

4A. Selenium + pytest — Test Outputs

4A.1 Screenshots

Screenshots are automatically captured by the pytest confest.py fixture on both pass and fail events. Files are saved to the screenshots/ directory with a timestamp-prefixed filename for traceability.

5. TEST REPORT

5A. Selenium + pytest — Test Report

Execution Summary

Metric	Value
Total Tests	7
Tests Passed	7
Tests Failed	0
Tests Skipped	0
Pass Rate	7 / 7 = 100 %
Execution Duration	~4 minutes
Report Format	Allure HTML + pytest-html

Accuracy Metric

Pass Rate = Total Passed / Total Tests × 100 = 7 / 7 × 100 = 100.00 %

5B. BDD behave — Test Report

Execution Summary

Metric	Value
Total Scenarios	7
Scenarios Passed	7
Scenarios Failed	0
Scenarios Skipped	0
Pass Rate	7 / 7 = 100 %
Feature Files	2
Execution Duration	~4.5 minutes

Report Format	Allure HTML (allure-behave)
---------------	-----------------------------

Accuracy Metric

Pass Rate = Total Passed / Total Scenarios $\times$ 100 = 7 / 7 $\times$ 100 = 100.00 %
